Atlantic Reclamation Conference
Wolfville, NS
October 2014

Road Map

- 1** Waste byproducts as amendments
- 2** Overview of response surface methodologies
- 3** Applying RSM: Optimizing waste byproduct amendments for revegetating gold mine tailings and quarry substrates

Mine Soil Constraints

Infertility

Add nutrients:
Organic amendment
Fertilizer

Physical Constraints

Break-up soil (tillage)
Promote aggregation (organic matter)

Toxicity

Increase pH (lime)
Add complexing agents:
Organics (compost)
Inorganic sorbent (iron oxides)

Organic and Liming Amendments

The Use of Soil Amendments for Remediation, Revitalization, and Reuse

- **Organics**
 - Adds nutrients and organic matter
 - Biosolids, composts, agronomic waste, manures, papermill sludges, wood chips, etc.
- **Soil Acidity/pH Amendments**
 - Increased pH reduces metal bioavailability and improves nutrient retention
 - Fly ash, wood ash, FGD sludge, etc. (20 – 80% CCE)
 - Used in conjunction with lime

Mineral Soil Conditioners

- **Foundry sand**
 - Modify soil texture
- **Steel slag**
 - Combined alkaline soil amendment, sorbent and micronutrient source
- **Dredged materials**
 - Modify soil texture or form soil profile
- **Phosphogypsum**
 - Enhance soil aggregation, offset sodicity and aluminum toxicity
- **Water Treatment residuals**
 - Modify soil texture and sorb trace metals

Application Rates

- **Organic Amendments**
 - Meet plant N requirements
 - Increase soil organic matter content (2 – 5%)
 - **But**, wastes can have imbalanced nutrients or high moisture content (↑ transport costs)
- **Acidity/pH Amendment**
 - Balance acidity using calcium carbonate equivalents (CCE)
 - **But**, wastes can have soluble salts, boron, heavy metals
- **Mineral Soil Conditioners**
 - Site and objective specific, but usually up to 100 Mg/ha
 - **But**, wastes can have soluble salts and trace metals

Response Surface Methods

Purpose:

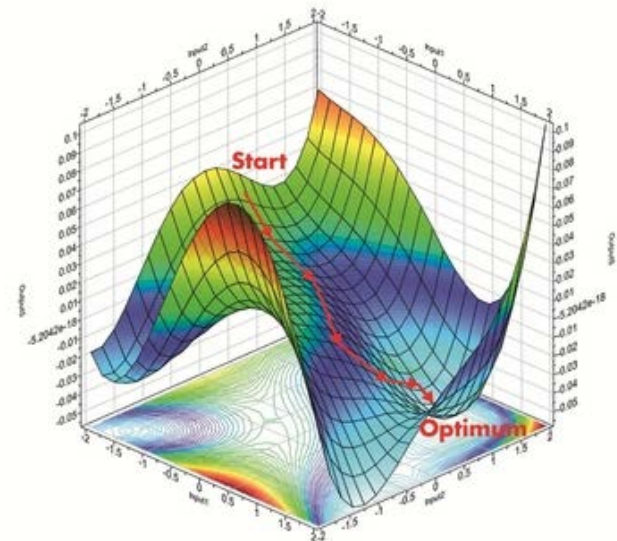

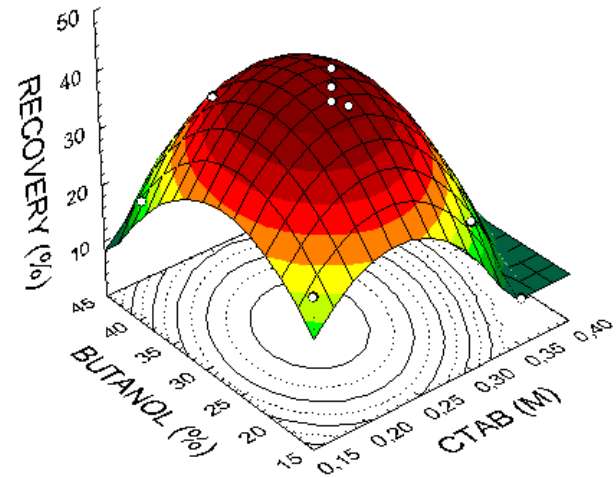

Predict operating conditions that yield an optimum response in one or more response factors

Benefits:

Optimization-specific experiments
Fewer experimental units and lower cost than factorial designs

Drawbacks:

Assumes all factors are important (i.e. no treatment comparison)
Requires advanced software for design and analysis

Research Objectives:

Verify response surface methodologies can be used for optimizing soil amendments

- Greenhouse experimentation
- Two case studies:
 - *Abandoned gold mine tailings (metal-contaminated)*
 - *Quarry overburden (infertile)*

Response: Vegetation Performance

Aboveground Biomass (Shoots)

- Maximize

Belowground biomass (Roots)

- Maximize

Root : Shoot ratio

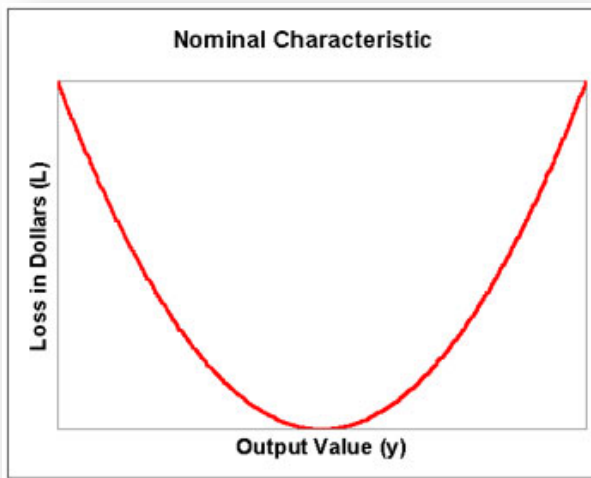

- Balanced (~1.0)

Response: Cost

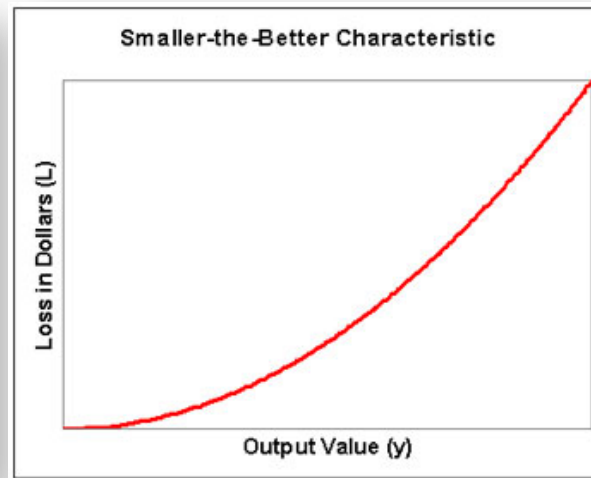

$$\text{Total Cost} = \text{Materials} + \text{Quality Loss}$$

Materials = Purchase + Transport

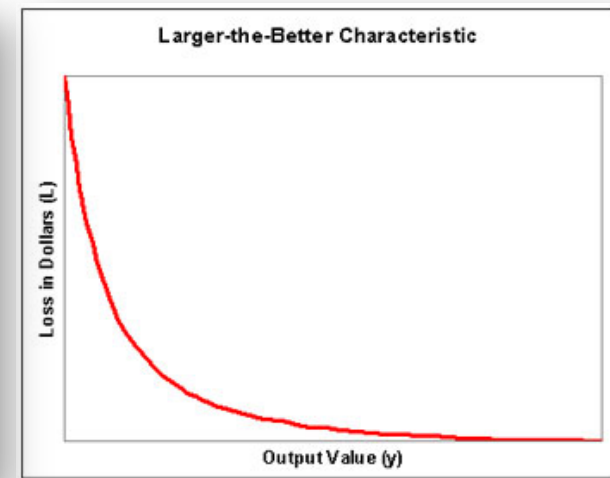

Quality Loss = Monetization of performance using Taguchi quality loss function

Target Objective

Minimum objective

Maximum objective

Case Study 1:

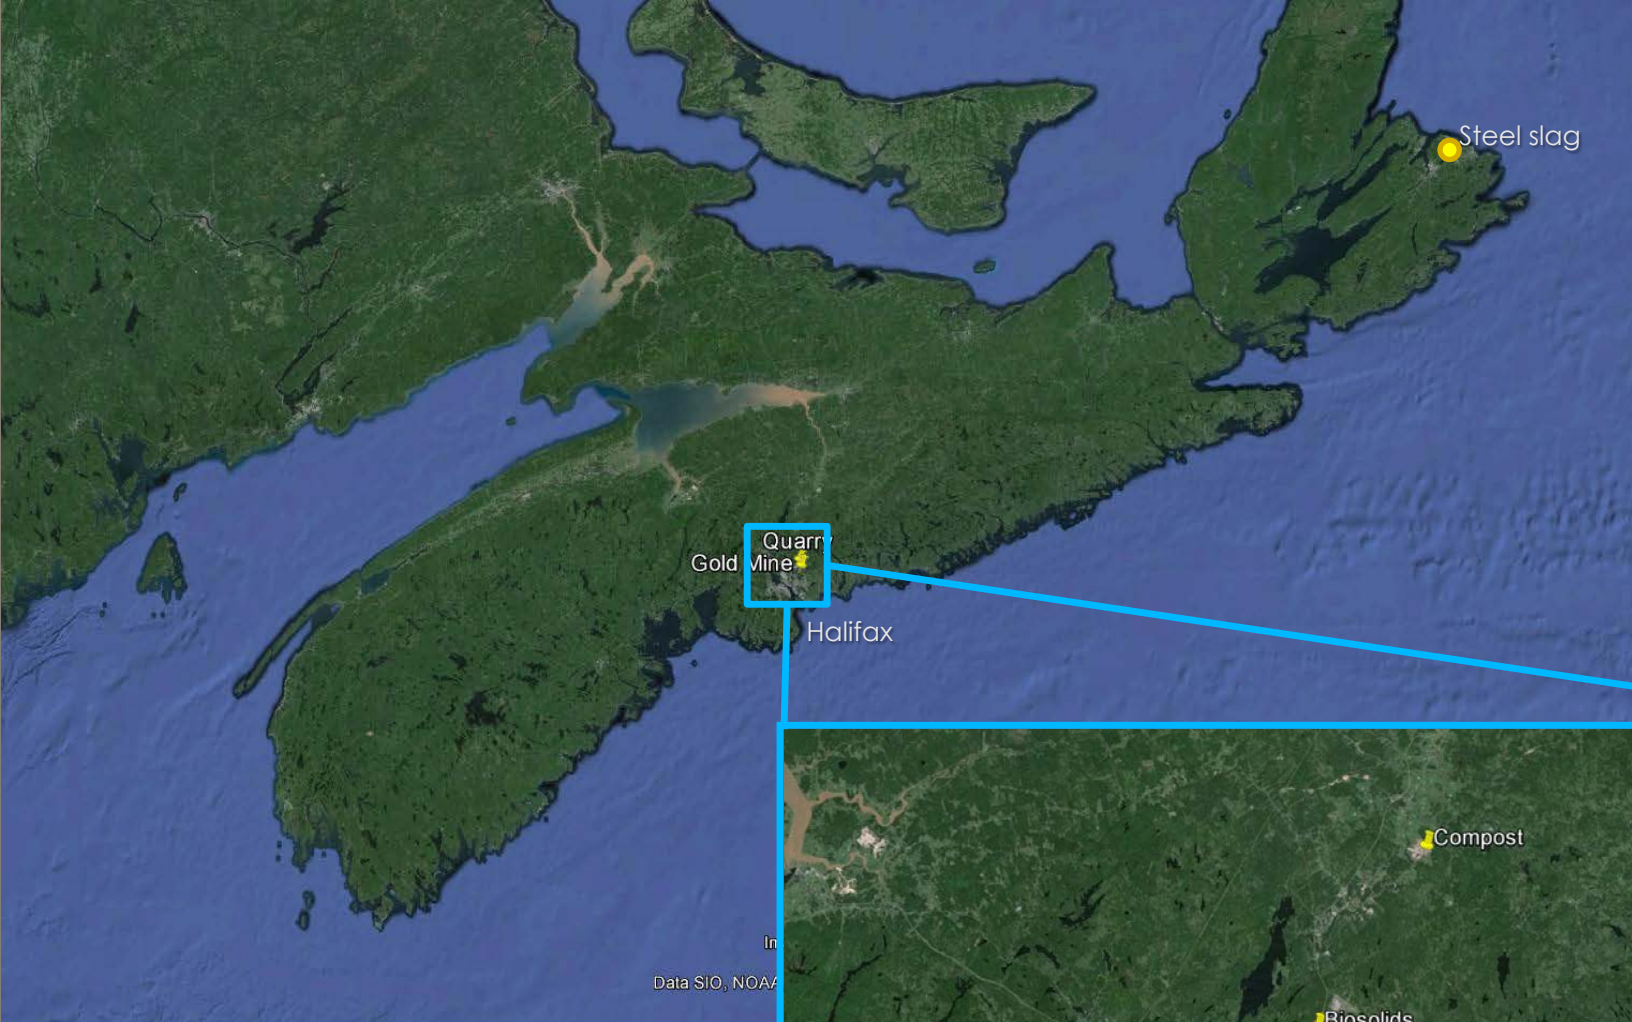

Phytostabilization of abandoned gold mine tailings

- Municipal solid waste compost (OM & Nutrients)
- Wood chips (C:N adjustment)
- Steel slag (As adsorbent & Alkalinity)

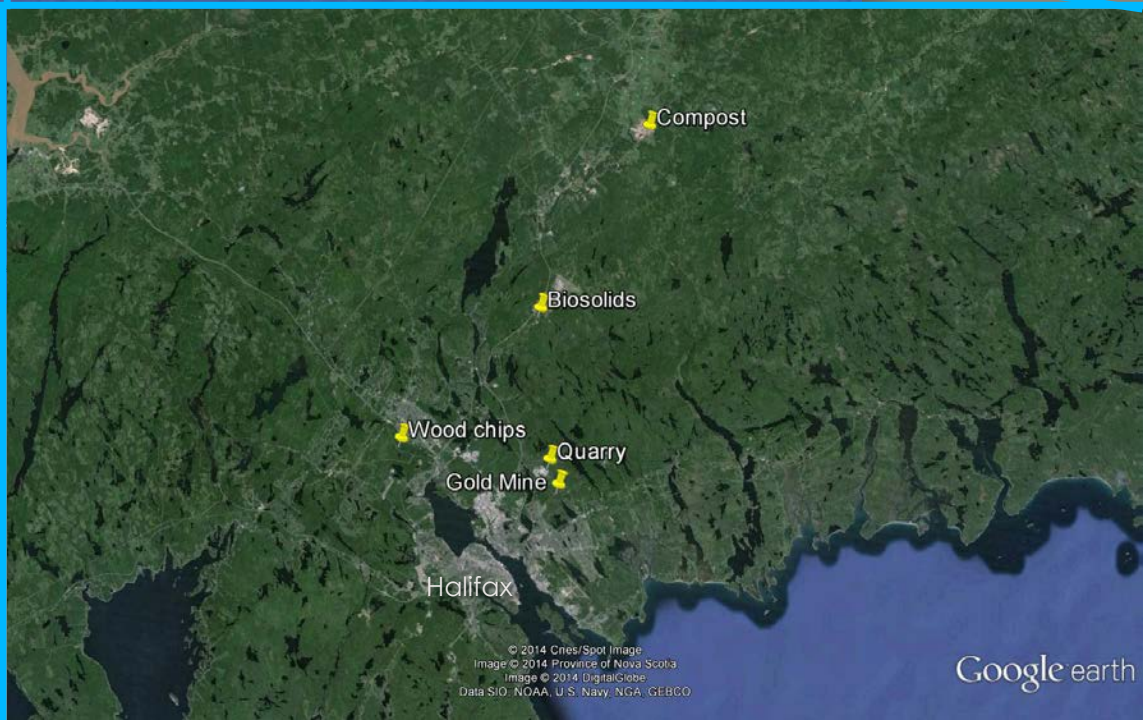

Case Study 2:

Quarry substrate revegetation

- Municipal solid waste compost (OM & Nutrients)
- Alkaline stabilized biosolids (Nutrients & Alkalinity)
- Wood chips (C:N adjustment)

Google earth

**Case Study 1:
Phytostabilization of
Abandoned Gold
Mine Tailings**

Study Site: Montague Gold Mine

ca. 1865 – 1940

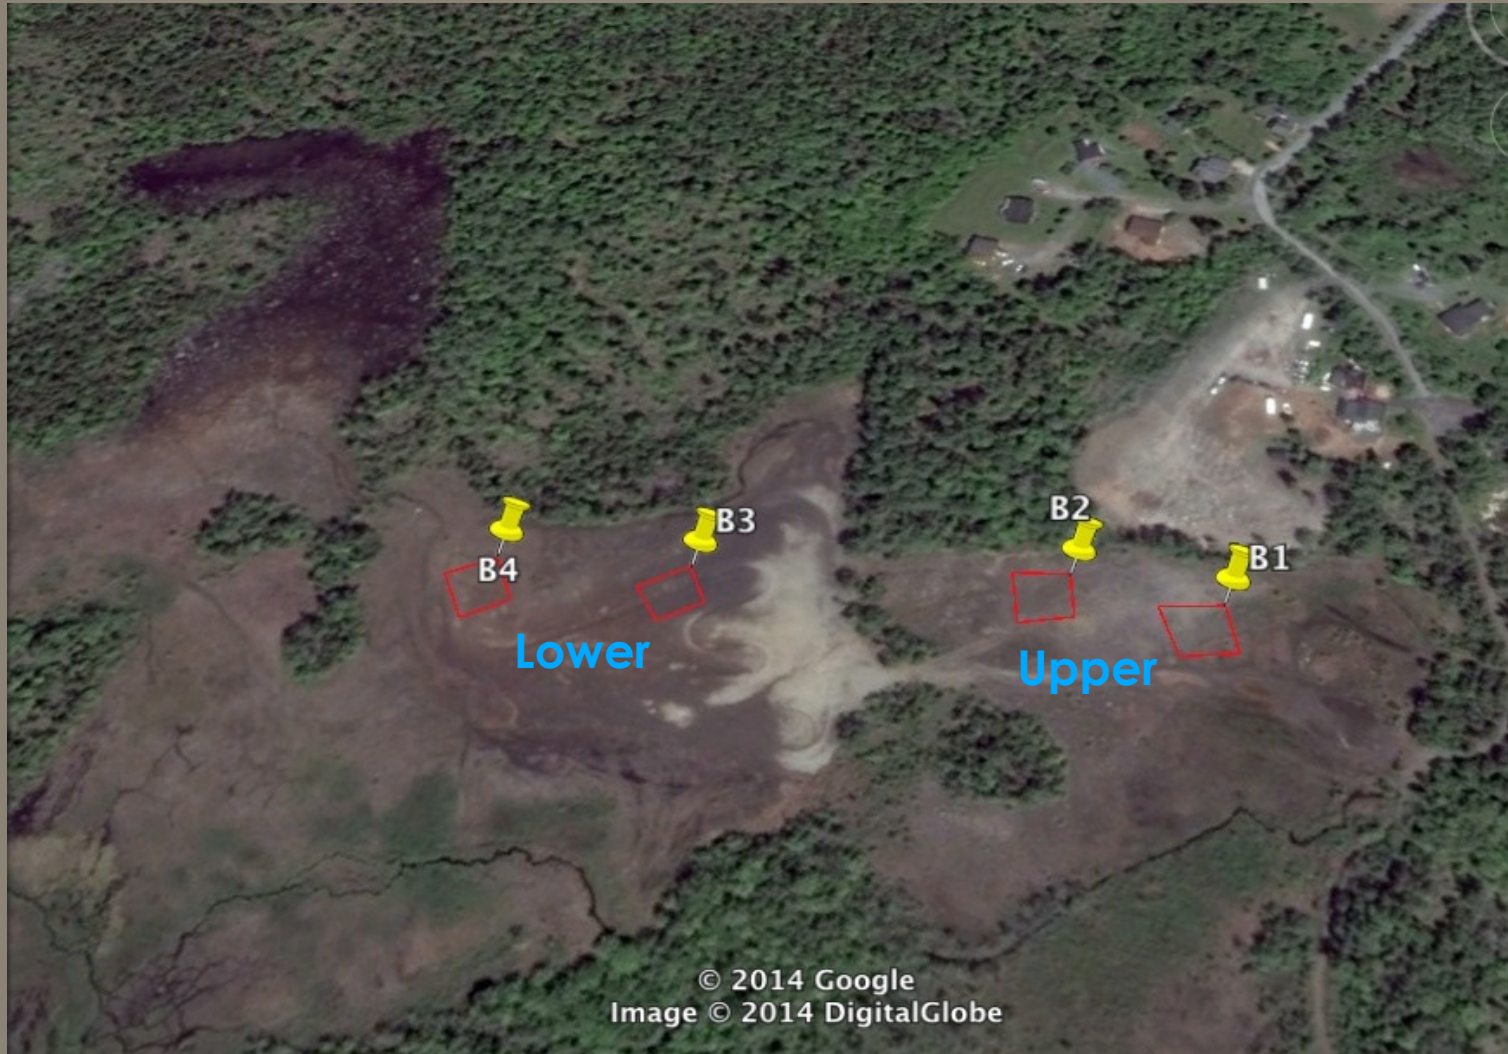

Arsenopyrite Deposit
Mercury Amalgamation

As (mg/kg): 2,600 – 43,000

Hg (mg/kg): 650 – 6,700

pH ~ 4.5 - 5.5

Sample Collection Areas

Montague Tailings

Upper

Amend

Oxidized
As available

Lower

Reduced
As bound

Component-Amount Design

MSW Compost
30 – 100 Mg/ha

Wood chips
0 – 10 Mg/ha

Steel slag
0 – 35 Mg/ha

Amendments varied independently

- Main effects
- Interactions

Logistics:

- Transport
- Application
- Incorporation

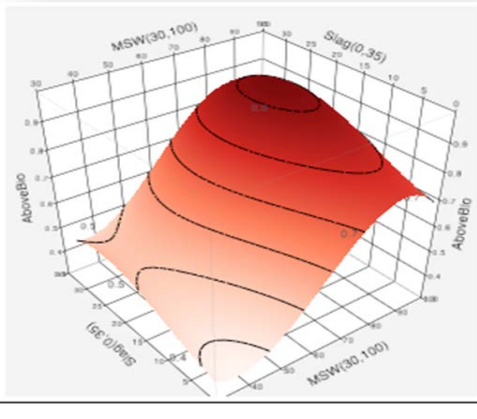

Greenhouse Experiment

- Seeded with tufted hairgrass (*Deschampsia cespitosa*)
- Incubated 50 days post-germination
- Measured above- and below-ground biomass
- Analyzing tissue and soil heavy metals

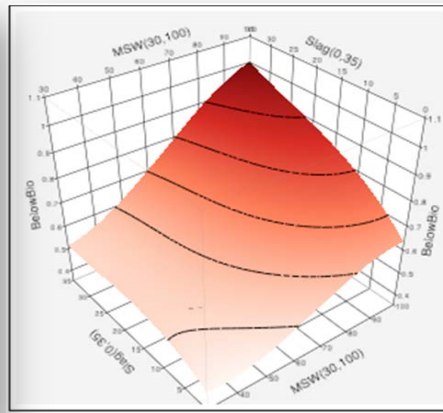

Response Surface Model

Shoot Biomass

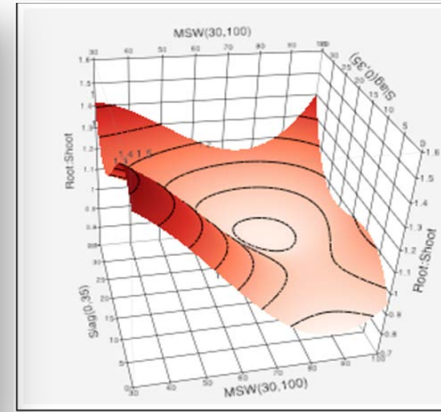

Maximum desired
Peak observed

Root Biomass

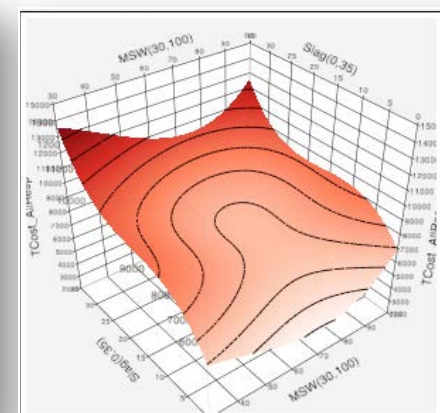

Maximum desired
Peak not observed

Root:Shoot Ratio

~1.0 desired
Trough observed

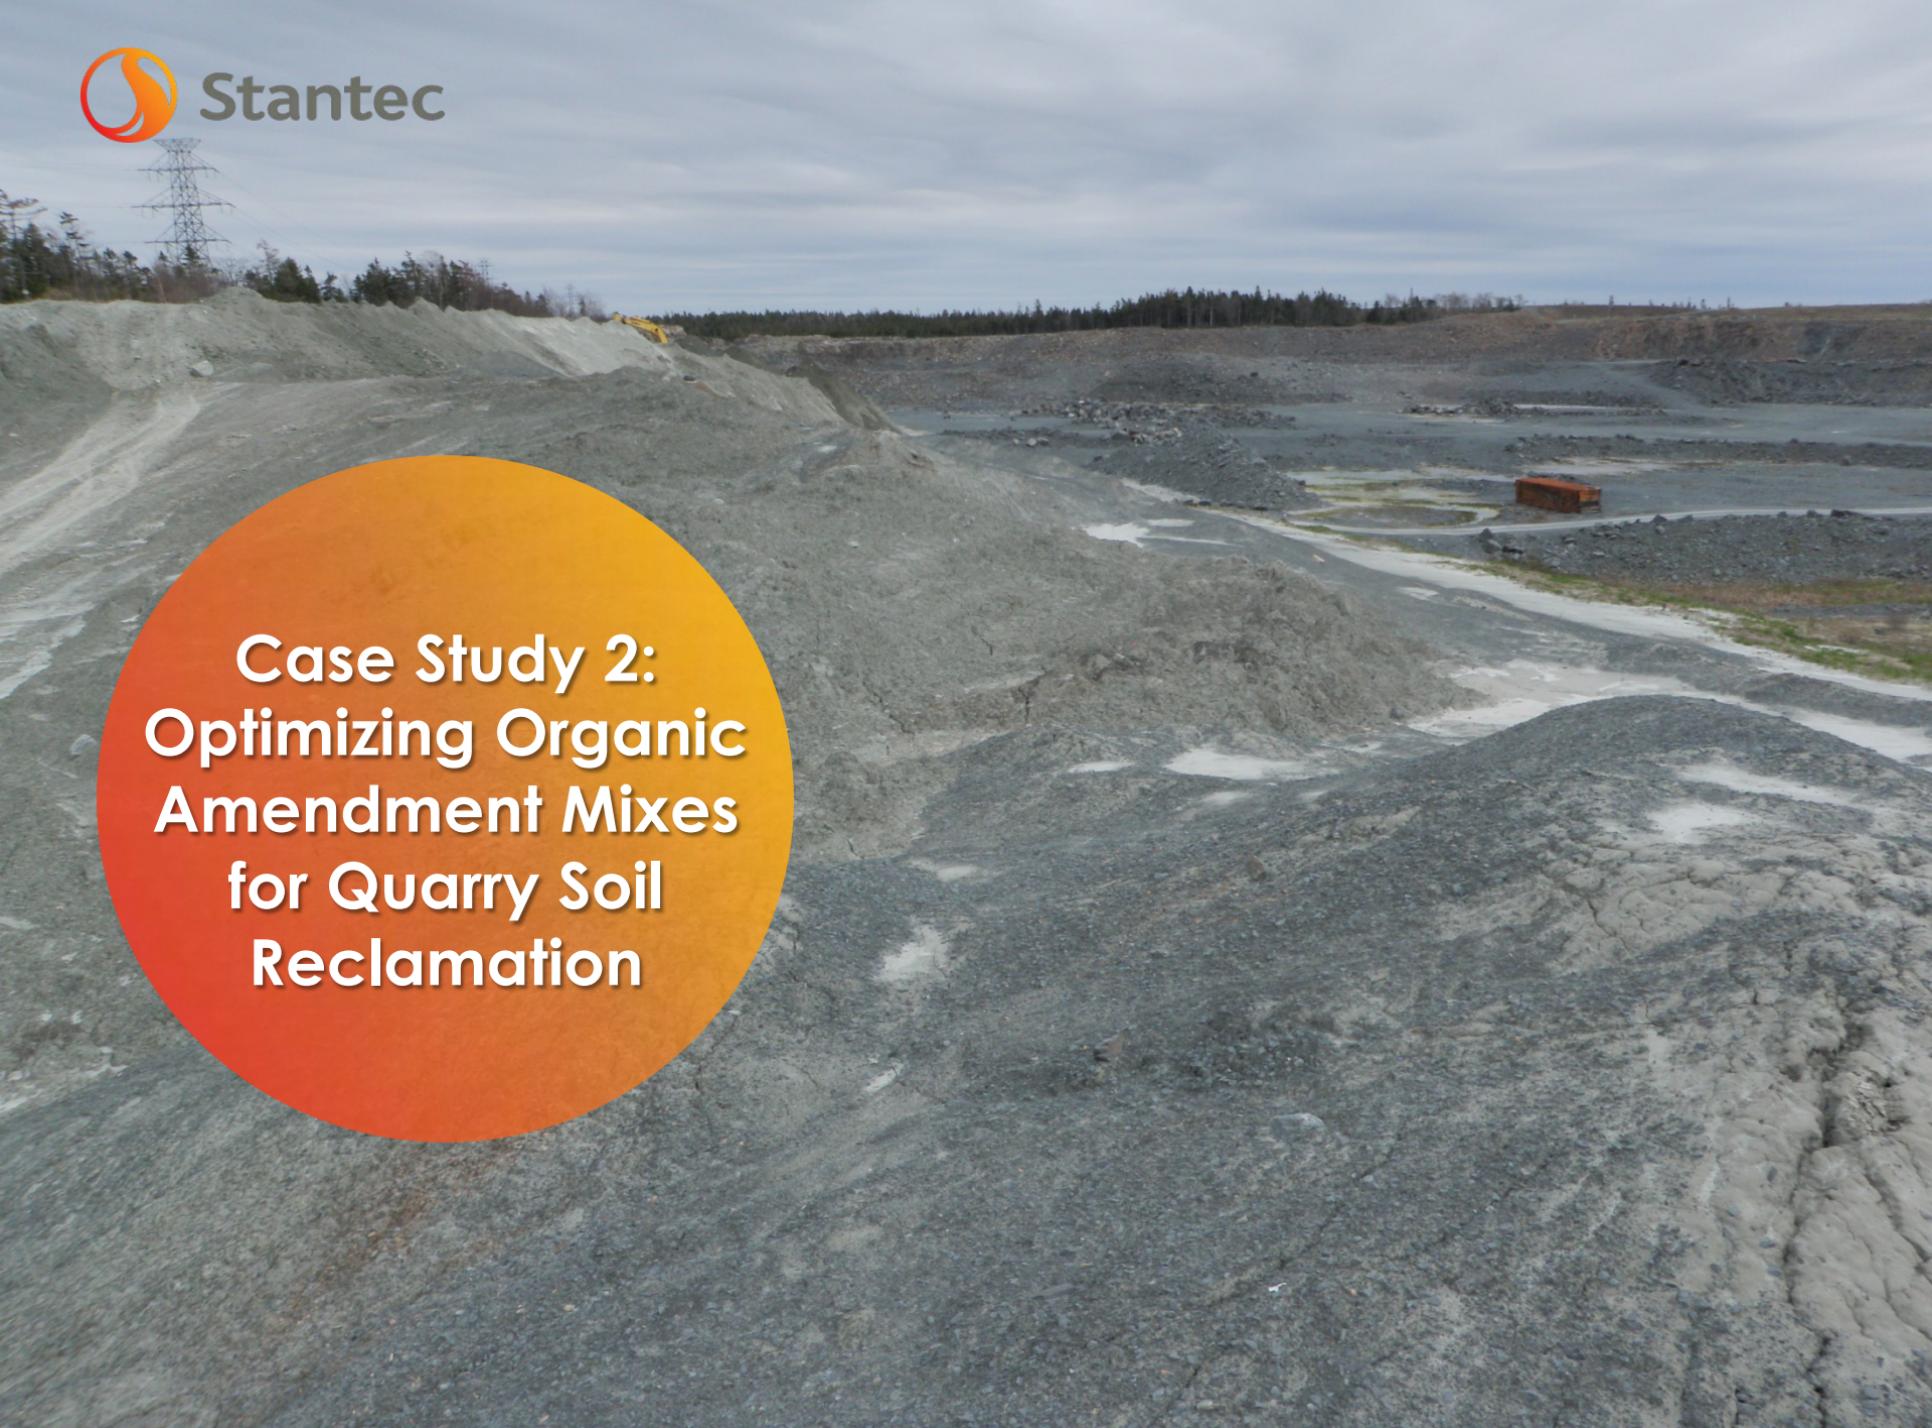

Total Cost

Minimum desired
"Plateau" observed

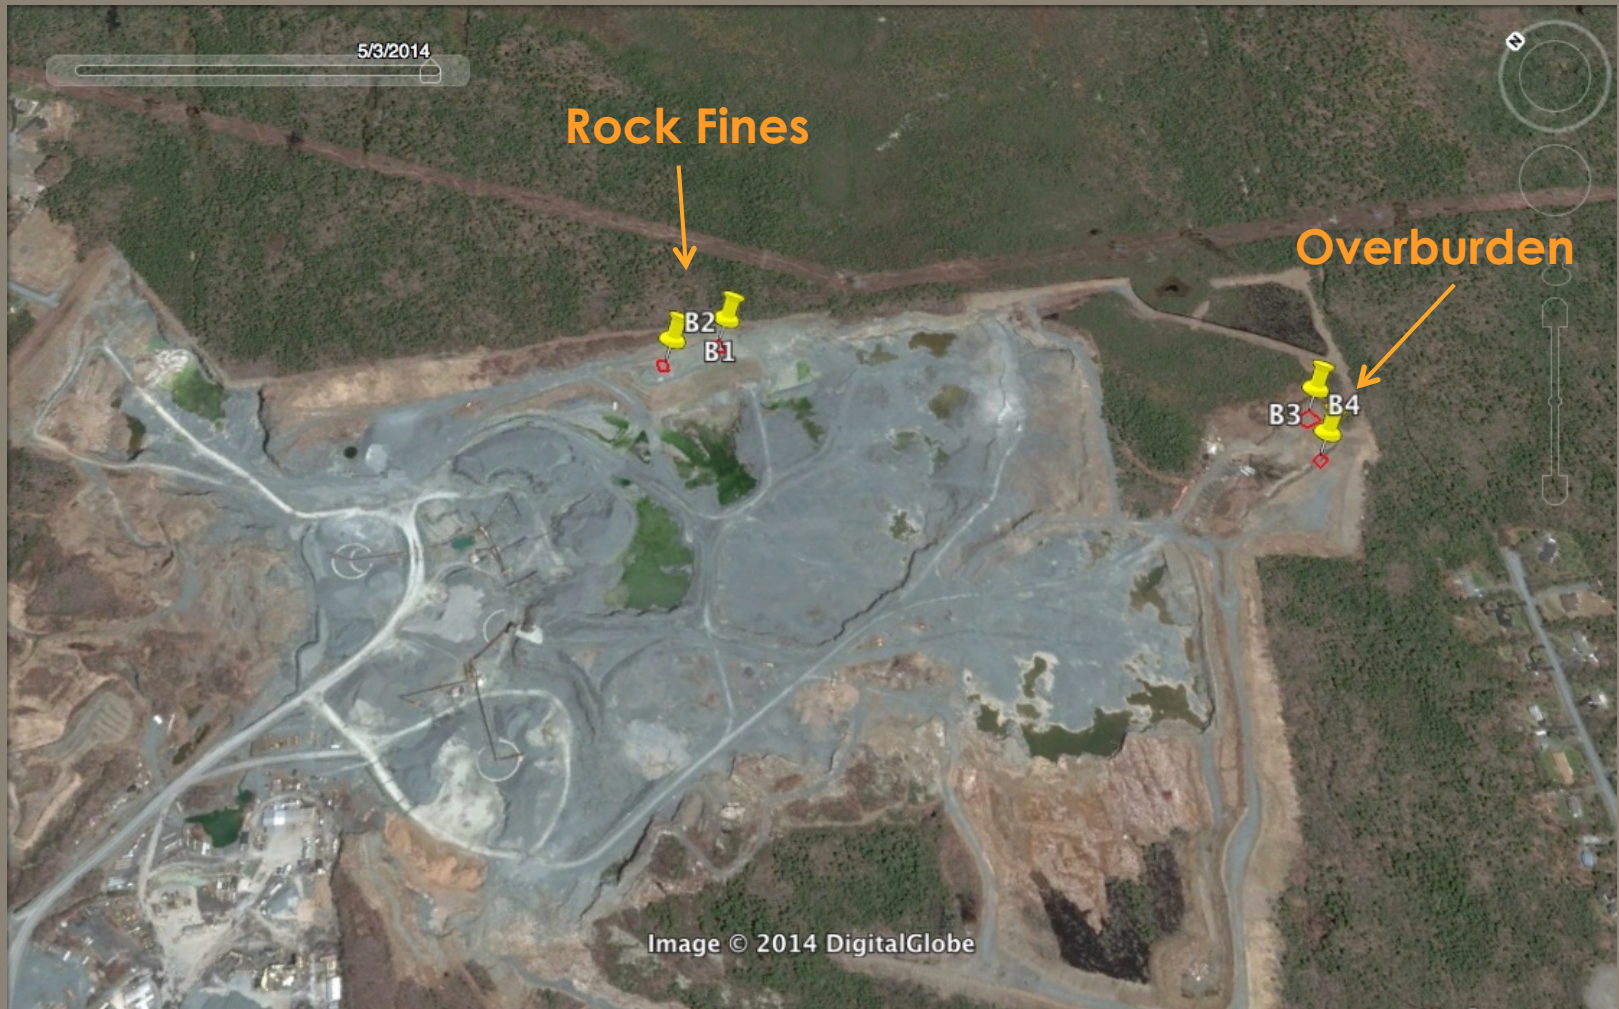

Optimum:

85 Mg/ha MSW compost, 24 Mg/ha steel slag and 2 Mg/ha wood chips

**Case Study 2:
Optimizing Organic
Amendment Mixes
for Quarry Soil
Reclamation**

Sample Collection Areas

Quarry Soils

Compact
Infertile: <0.5% OM

Mixture-Amount Design

Blended Amendment

Amount:
30 – 100 Mg/ha

Mixture:
0 – 100% MSW Compost
0 – 100% Biosolids
0 – 10% Wood chips

**Assess blending behavior and
influence of total application**

Why? Logistics:

- Storage
- Availability
- Incorporation

Greenhouse Experiment

100 Mg/ha
100% MSW Compost

Seeded with Nova Scotia Highway Mix:

40% red fescue | 20% timothy | 15% tall fescue | 15% perennial ryegrass | 15% kentucky bluegrass

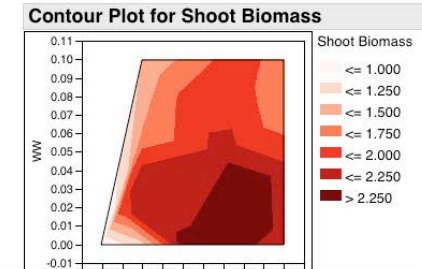

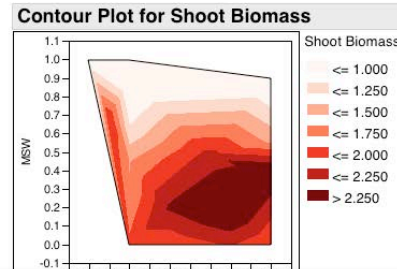

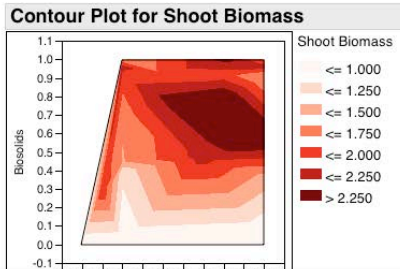

Biomass harvested 50 days following germination

Biosolids

MSW Compost

Wood

Shoots

50 – 90 Mg/ha: High proportion biosolids, lower proportions MSW and Wood

Roots

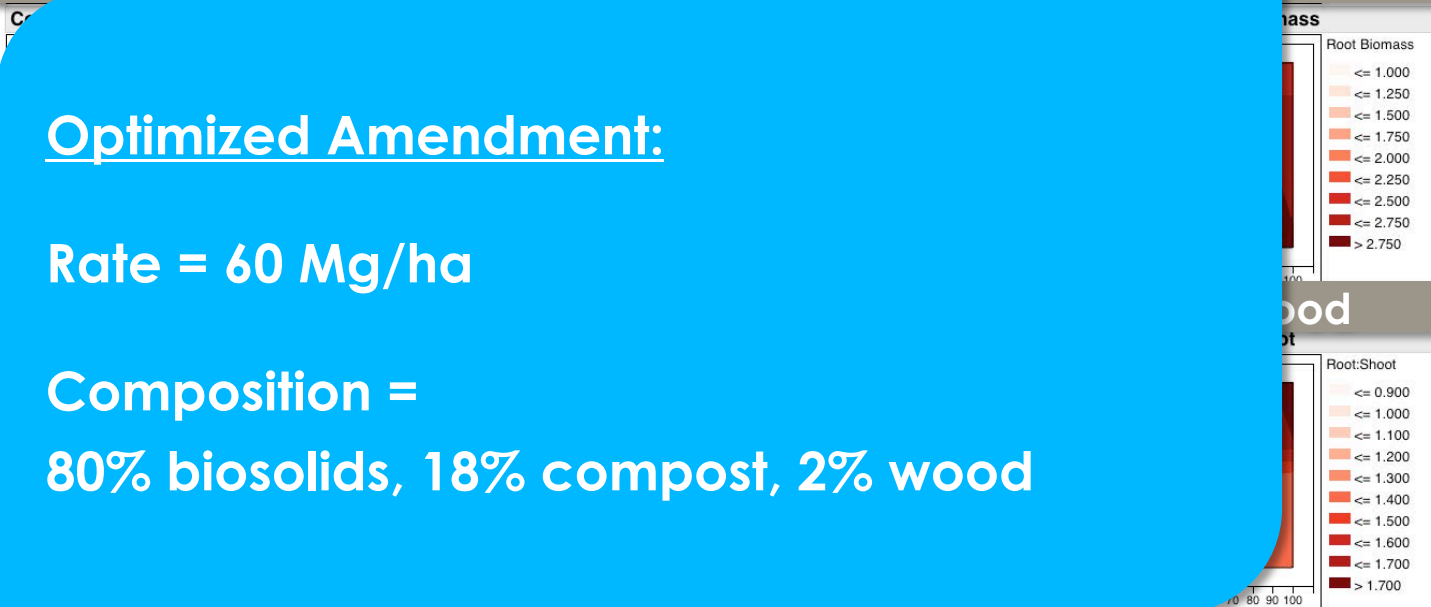

Optimized Amendment:

Rate = 60 Mg/ha

Composition =
80% biosolids, 18% compost, 2% wood

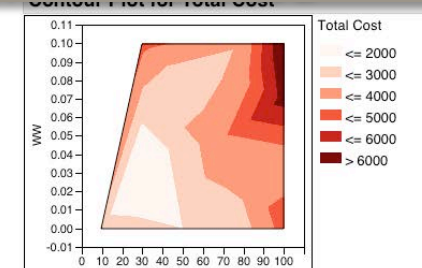

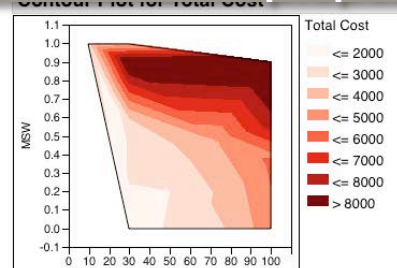

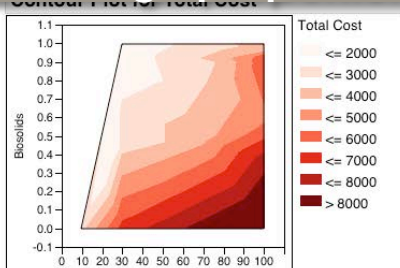

70 – 100 Mg/ha

Root:
Shoot

30 – 70 Mg/ha: High proportion biosolids, lower proportions MSW and Wood

Total
Cost

<80 Mg/ha: High proportion biosolids, lower proportions MSW and Wood

Summary

1 Response surface methods (RSM) worked well for amendment optimization in greenhouse

2 RSM-based optimization can improve project performance and economics

- *Avoid under/over-application and potential toxicity*

3 Field validation is required and ongoing

- *Quarry: RSM design in field – compare against greenhouse*
- *Tailings: Temporal stability \pm mycorrhizal fungi*

Prediction Profiler

1. Fit statistical model for each response

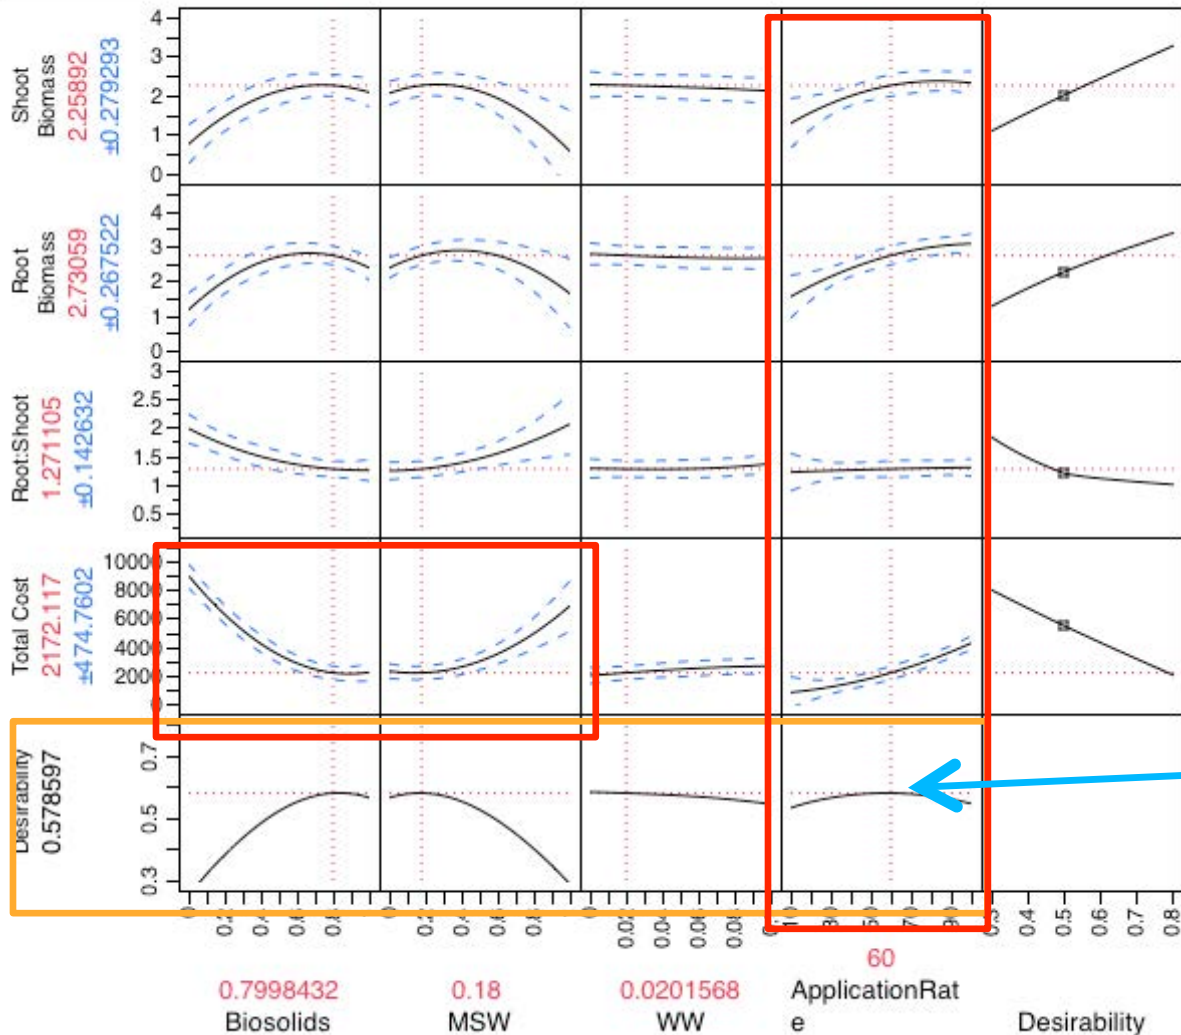

2. Fit individual desirability functions

3. Maximize overall desirability

Optimum: 85 Mg/ha MSW compost,
24 Mg/ha steel slag and 2 Mg/ha wood chips

Prediction Profiler

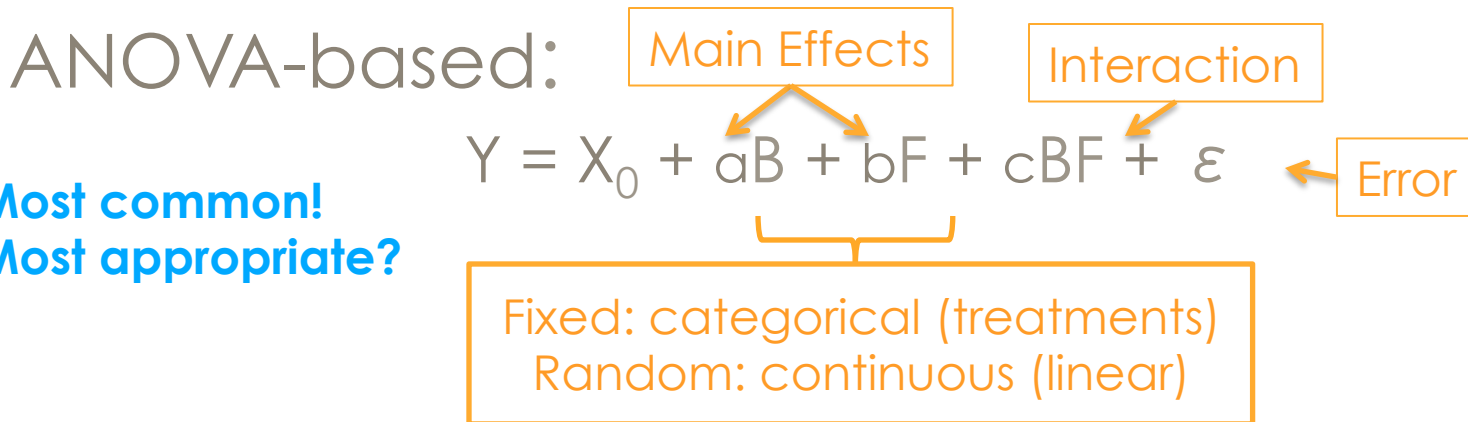

Rate:
Compromise
between
performance
and cost

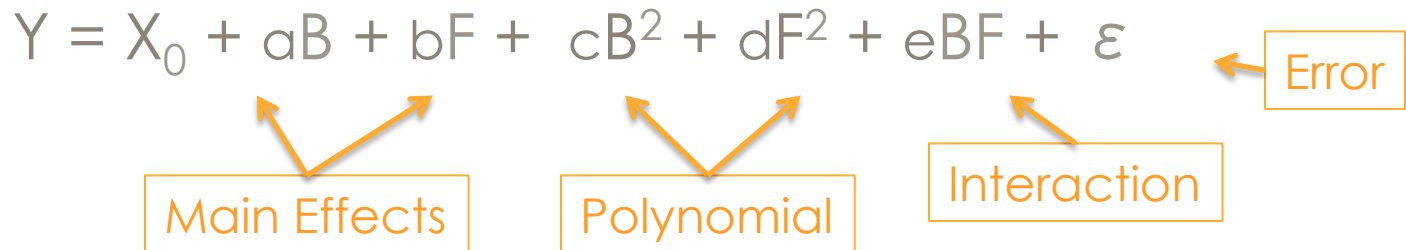

Optimum: **60 Mg/ha** amendment composed of **80% biosolids**, **18% MSW compost** and **2% wood chips**

Experimental Designs

E.g. B = biosolids (Mg/ha); F = fly ash (Mg/ha)

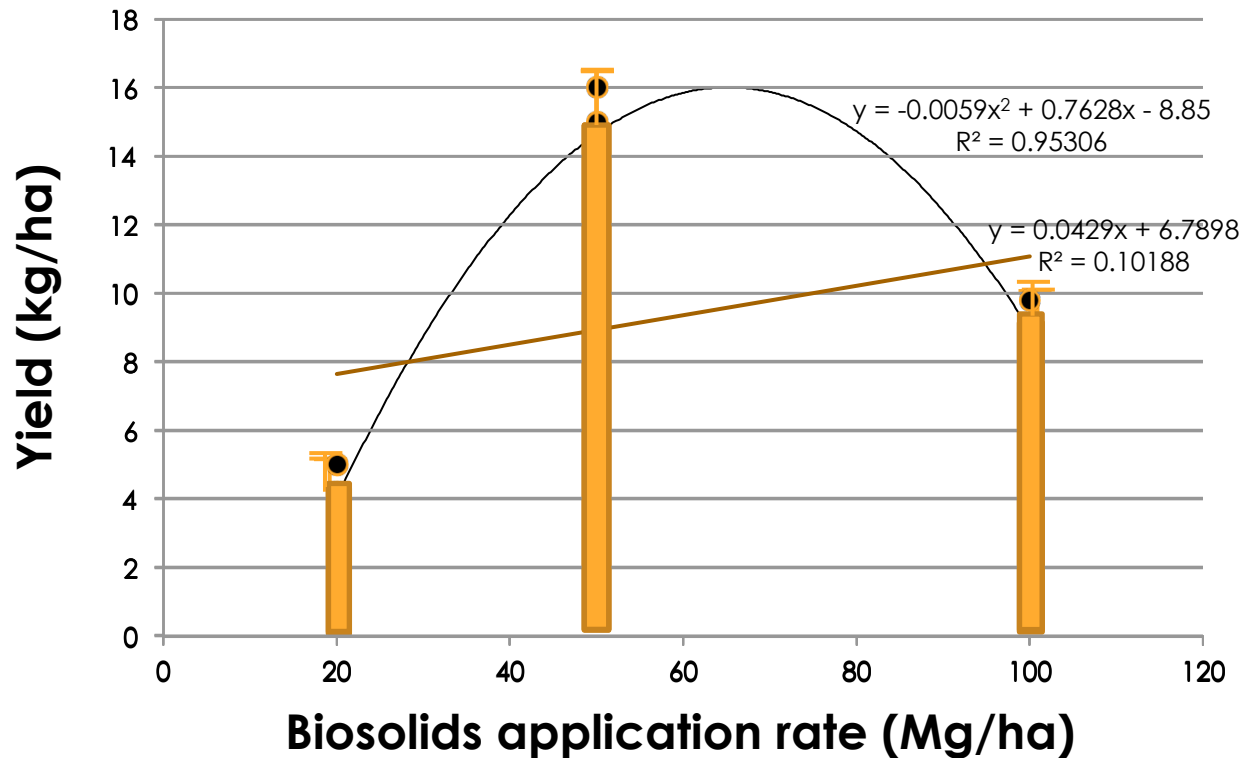

Response surface methods (RSM):

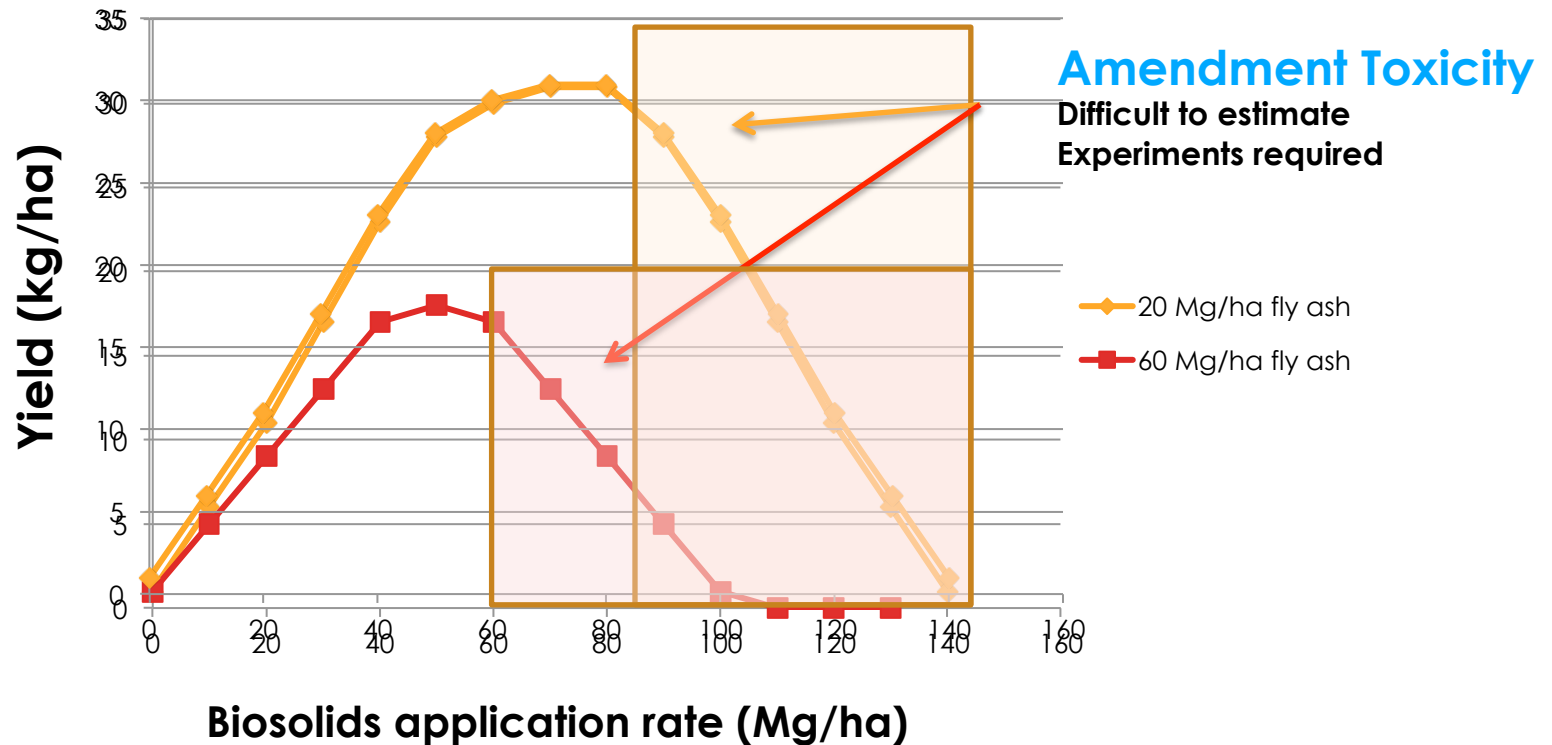

All Continuous! (Required for optimization)

Model Comparison

Example: Plant Response to Biosolids

Polynomial Effect: "Curvature" in response due to phytotoxic compounds

Interaction Effect: Different response at different rates of additional factor
